The University of Texas at Arlington

Lecture 5
PIC I/O and LCD Control

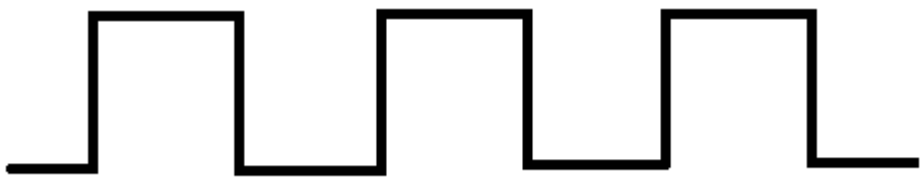
CSE 3442/5442

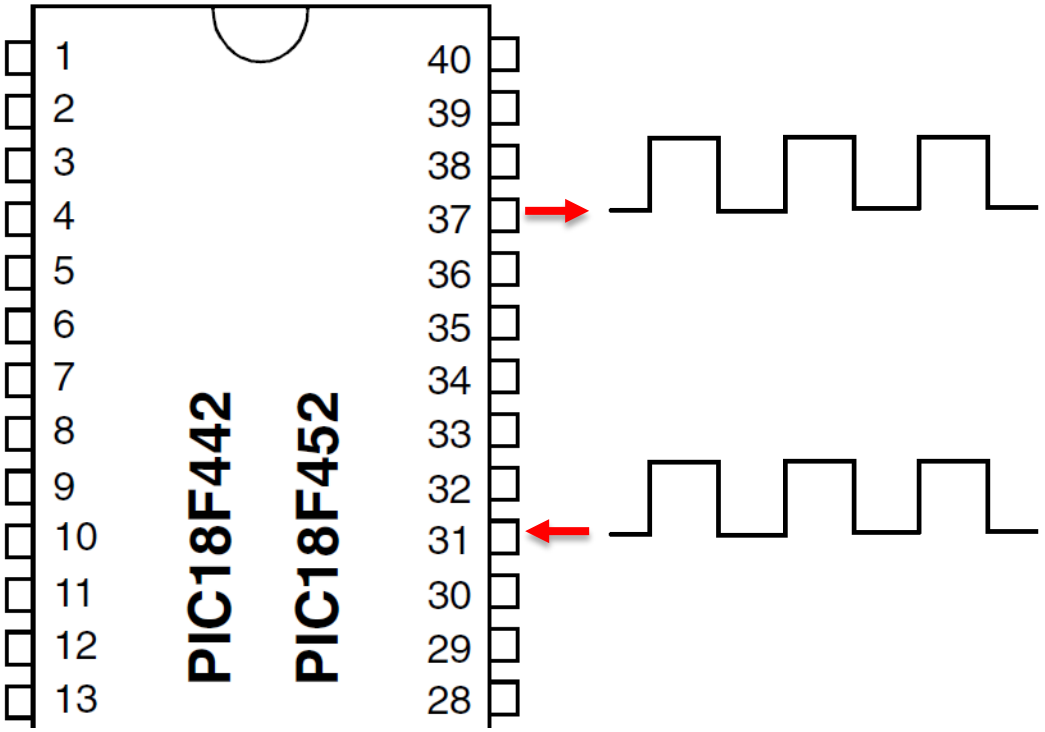
Embedded Systems I

Based heavily on slides by Dr. Gergely Záruba and Dr. Roger Walker

Digital Input/Output

- **Only two states**
  - ON / OFF
  - HIGH / LOW
  - 1 / 0

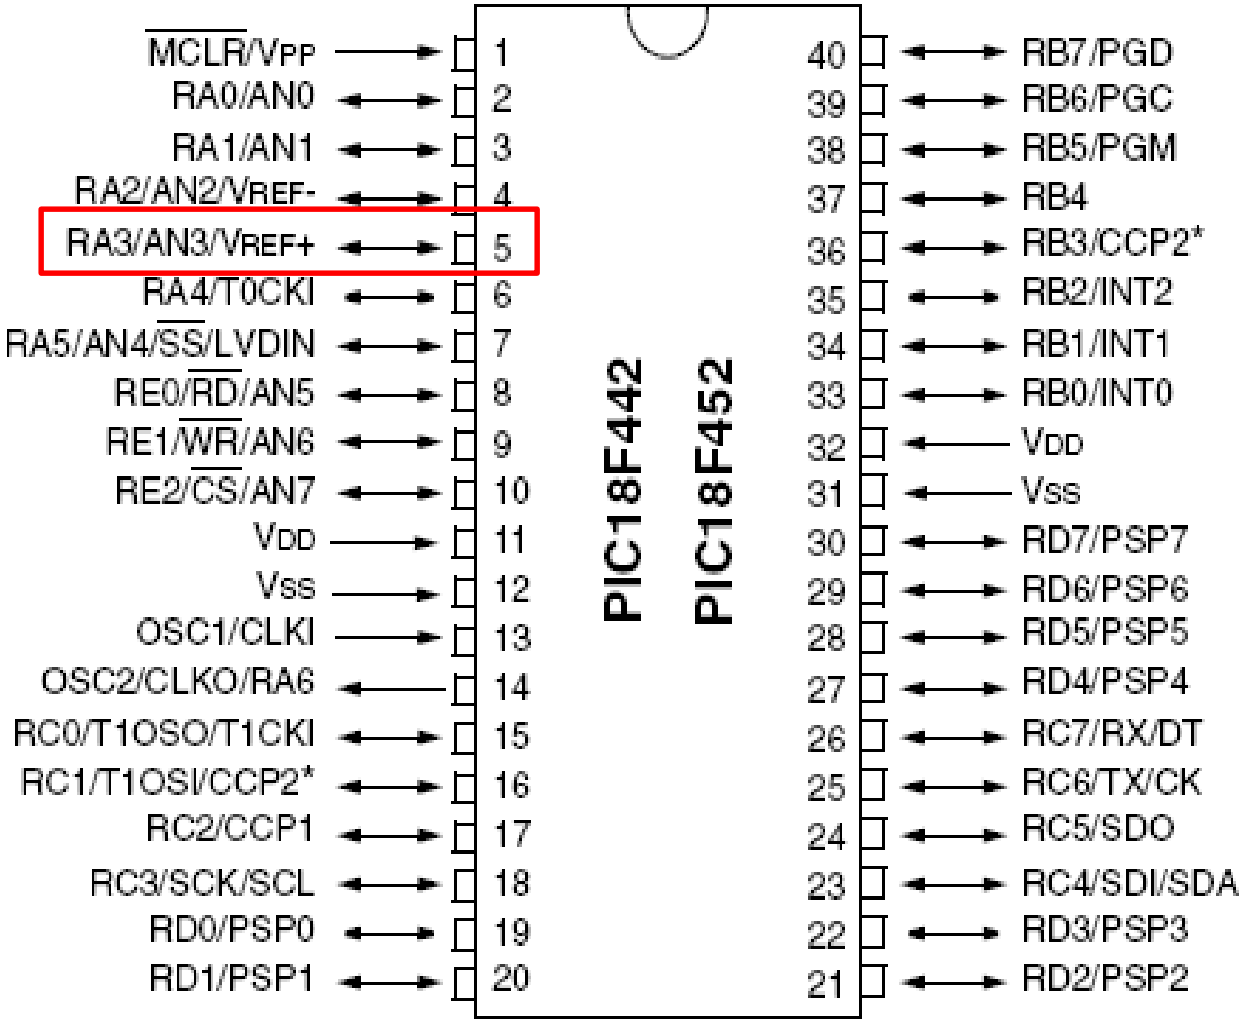




Chapter 4 – PIC I/O PORT PROGRAMMING

- Ports are not only used for simple I/O, but also can be used other functions
  - ADC (analog-to-digital conversion)
  - Timers
  - Oscillator Input
  - Interrupts
  - Serial communication
  - Capturing and Generating PWM Signals
  - Programming the PIC

PIC18F452 Pin Diagram



Pin 5: RA3/AN3/Vref+

						PORTA is a bi-directional I/O port.
RA0/AN0	2	3	19			
RA0				I/O	TTL	Digital I/O.
AN0				I	Analog	Analog input 0.
RA1/AN1	3	4	20			
RA1				I/O	TTL	Digital I/O.
AN1				I	Analog	Analog input 1.
RA2/AN2/VREF-	4	5	21			
RA2				I/O	TTL	Digital I/O.
AN2				I	Analog	Analog input 2.
VREF-				I	Analog	A/D Reference Voltage (Low) input.
RA3/AN3/VREF+	5	6	22			
RA3				I/O	TTL	Digital I/O.
AN3				I	Analog	Analog input 3.
VREF+				I	Analog	A/D Reference Voltage (High) input.
RA4/T0CKI	6	7	23			
RA4				I/O	ST/OD	Digital I/O. Open drain when configured as output.
T0CKI				I	ST	Timer0 external clock input.
RA5/AN4/$\overline{SS}$/LVDIN	7	8	24			
RA5				I/O	TTL	Digital I/O.
AN4				I	Analog	Analog input 4.
$\overline{SS}$				I	ST	SPI Slave Select input.
LVDIN				I	Analog	Low Voltage Detect Input.
RA6						(See the OSC2/CLKO/RA6 pin.)

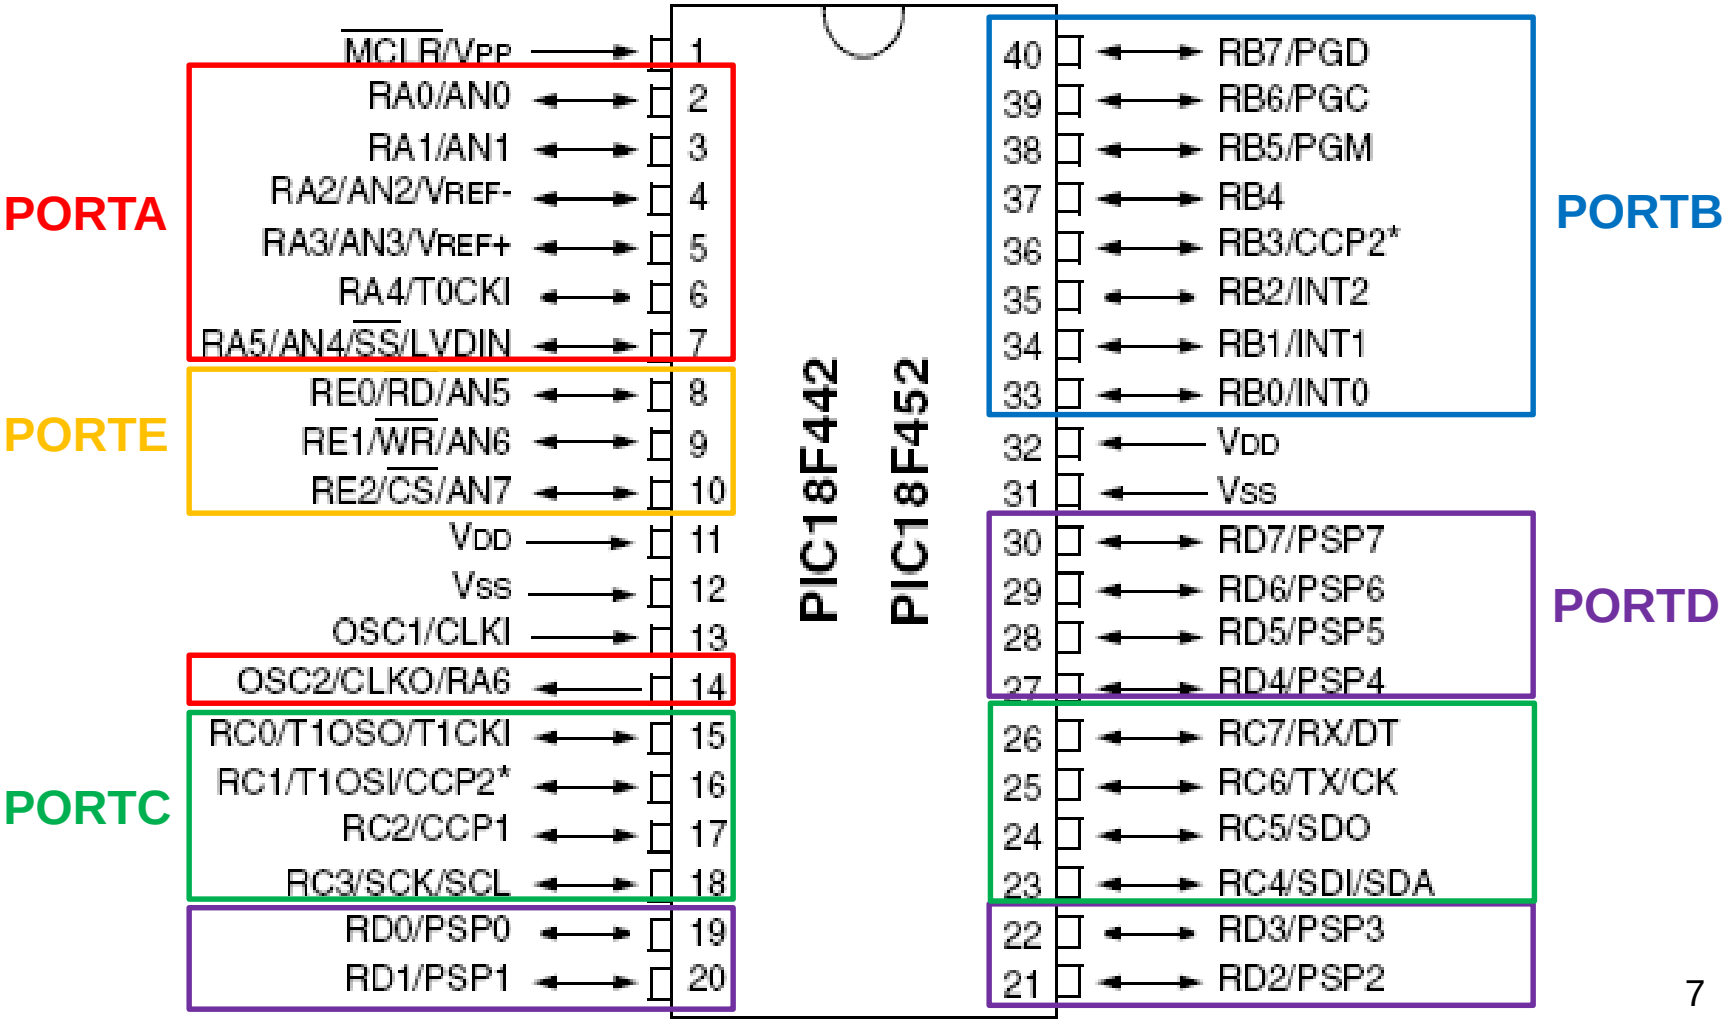
PIC18F452 (40 Pins) has 5 ports, other Family Members Can Have More or Less

Table 4-1: Number of Ports in PIC18 Family Members

Pins	18-pin	28-pin	40-pin	64-pin	80-pin
Chip	PIC18F1220	PIC18F2220	PIC18F458	PIC18F6525	PIC18F8525
Port A	X	X	X	X	X
Port B	X	X	X	X	X
Port C		X	X	X	X
Port D			X	X	X
Port E			X	X	X
Port F				X	X
Port G				X	X
Port H				X	X
Port J				X	X
Port K					X
Port L					X

Note: X indicates that the port is available.

PIC18F452 Pin Diagram
5 Ports



Number of Individual Port Pins

- For example, the PIC18F452
  - Port A has 7 pins
  - Ports B, C, and D each have 8 pins
  - Port E has only 3 pins

    →34 total digital IO pins
- Each port has three SFRs associated
  - **PORTx**
  - **TRISx (TRIState)**
  - **LATx (LATch)**

SFRs in the File Registers

TRISx

- Each of the Ports A-E in the PIC18F452 can be used for **input** or **output**
  - **TRISx** SFR is used solely for the purpose of making a given port an **input** or **output** port
    - TRISx bit = 0 →PORTx bit is an OUTPUT
      - Can now **write to** the PORTx bit(s)
    - TRISx bit = 1 → PORTx bit is an INPUT
      - Can now **read in** from the PORTx bit(s)
  - Can set I/O bit-by-bit or whole TRIS at once

PORTx and LATx

- **PORTx**
  - For reading input coming into the PIC
    - Digital High (1) or Low (0)
  - For writing output from the PIC
    - Writing a 1 → pin is High, 0 → pin is Low
- **LATx**
  - For writing output from the PIC
    - Writing a 1 → pin is High, 0 → pin is Low
- Point of the Latch??

PORTB Example

TABLE 9-4: SUMMARY OF REGISTERS ASSOCIATED WITH PORTB

Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on POR, BOR	Value on All Other RESETS
PORTB	RB7	RB6	RB5	RB4	RB3	RB2	RB1	RB0	xxxx xxxx	uuuu uuuu
LATB	LATB Data Output Register								xxxx xxxx	uuuu uuuu
TRISB	PORTB Data Direction Register								1111 1111	1111 1111
INTCON	GIE/ GIEH	PEIE/ GIEL	TMR0IE	INT0IE	RBIE	TMR0IF	INT0IF	RBIF	0000 000x	0000 000u
INTCON2	RBPU	INTEDG0	INTEDG1	INTEDG2	—	TMR0IP	—	RBIP	1111 -1-1	1111 -1-1
INTCON3	INT2IP	INT1IP	—	INT2IE	INT1IE	—	INT2IF	INT1IF	11-0 0-00	11-0 0-00

Legend: x = unknown, u = unchanged. Shaded cells are not used by PORTB.

Example
PORTA as an INPUT

In order to make all the bits of Port A an input, TRISA must be programmed by writing 1 to all the bits. In the code below, Port A is configured first as an input port by writing all 1 s to register TRISA, and then data is received from Port A and saved in some RAM location of the file registers:

```
MYREG   EQU 0X20        ;Program location (RAM)

MOVLW   B‘11111111’     ;All 1’s to WREG
MOVWF   TRISA           ;PORTA as INPUT port (1 for In)

MOVF    PORTA, W        ;move from filereg of PORTA to WREG
MOVWF   MYREG           ;save in fileReg of MYREG
```

Register bit manipulation

- Bit set flag
  - **BSF filereg, bit** **BSF TRISB, 4**
- Bit clear flag
  - **BCF filereg, bit** **BCF PORTB, 2**
- Bit toggle flag
  - **BTF filereg, bit**
- Bit test filereg skip next instruction if clear (0)
  - **BTFSC filereg, bit**
- Bit test filereg skip next instruction if set (1)
  - **BTFSS filereg, bit**

Working with I/O Ports in C
Whole BYTES at a Time

```
#include <xc.h>          //OLD → #include <p18F452.h>

void main(void)
{
    unsigned char mybyte;
    TRISC = 0b11111111;  //PORTC is input
    TRISB = 0b00000000;  //PORTB is output
    TRISD = 0b00000000;  //PORTD is output

    while(1)
    {
        mybyte = PORTC;   //load the value of PORTC

        if(mybyte < 100)
            PORTB = mybyte;  //send it to PORTB is it is less than 100
        else
            PORTD = mybyte; //otherwise, send to PORTD
    }
}
```

Working with I/O Ports in C
Single BITS at a Time

```
#include <xc.h>                    //OLD → #include <p18F452.h>

void main(void)
{
    unsigned char mybyte;
    TRISC = 0b11111111;  //PORTC is input
    TRISB = 0b00000000;  //PORTB is output
    TRISBbits.RB4 = 1;
    TRISD = 0b00000000;  //PORTD is output

    while(1)
    {
        mybyte = PORTC;   //load the value of PORTC

        if(mybyte < 100)
            PORTB = mybyte;  //send it to PORTB is it is less than 100
        else
            PORTD = mybyte; //otherwise, send to PORTD

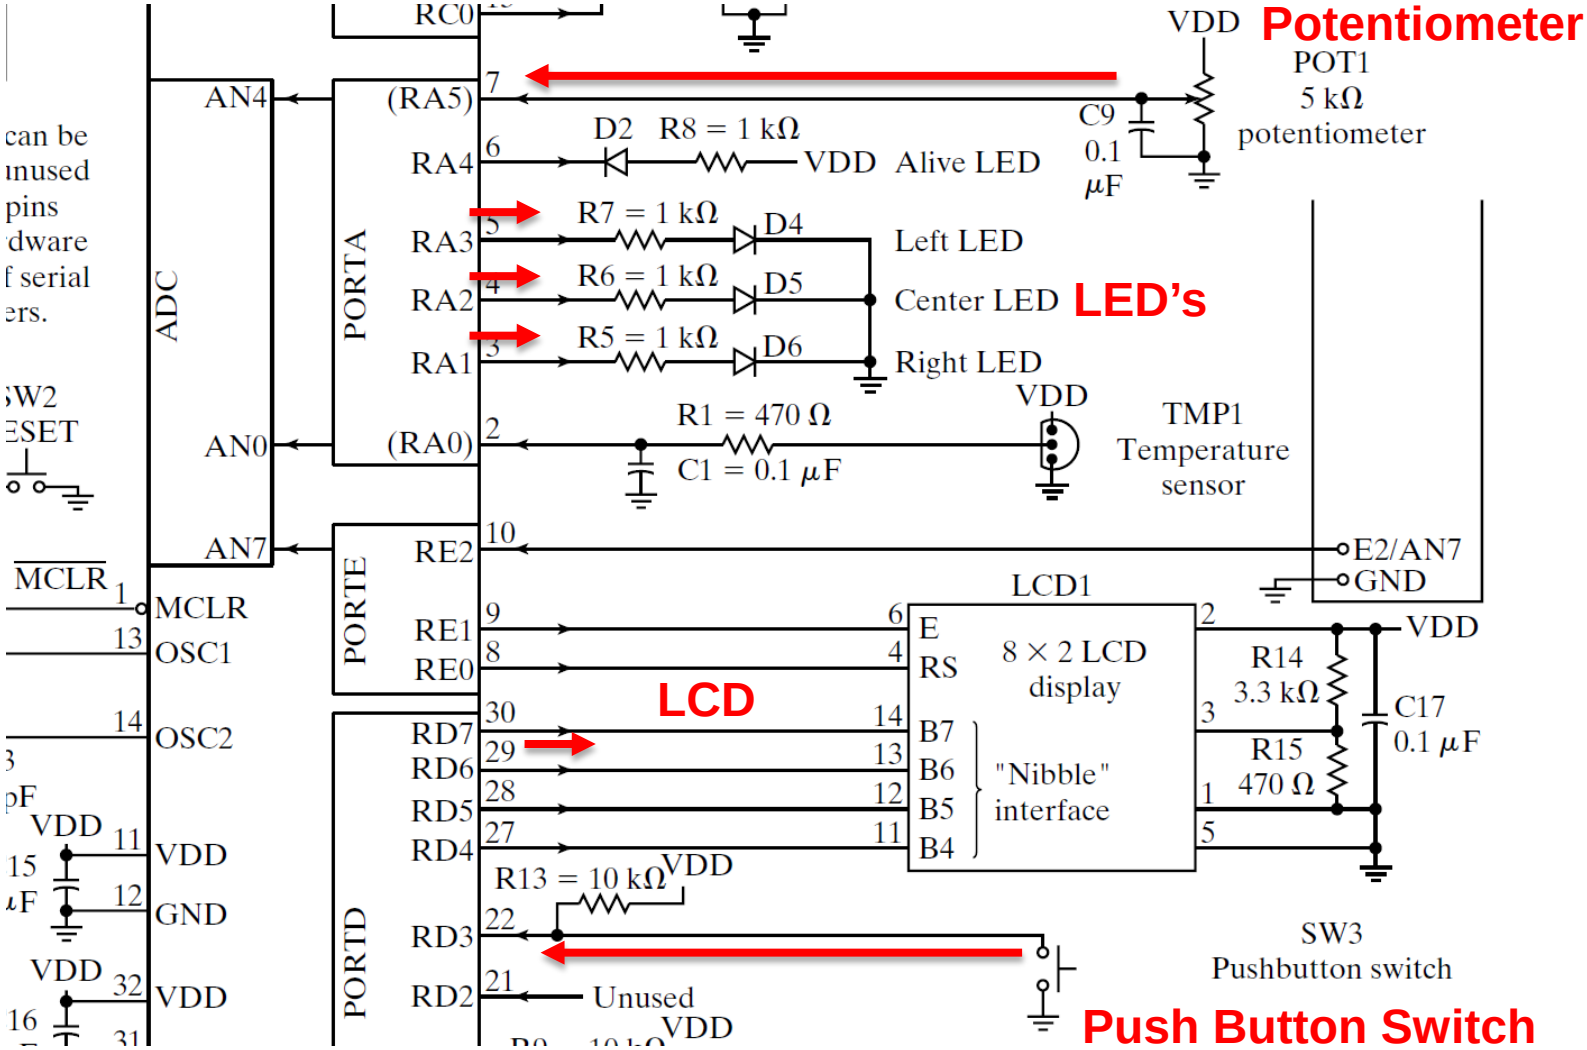
        mybyte = PORTCbits.RC1;
    }
}
```

Fan-out

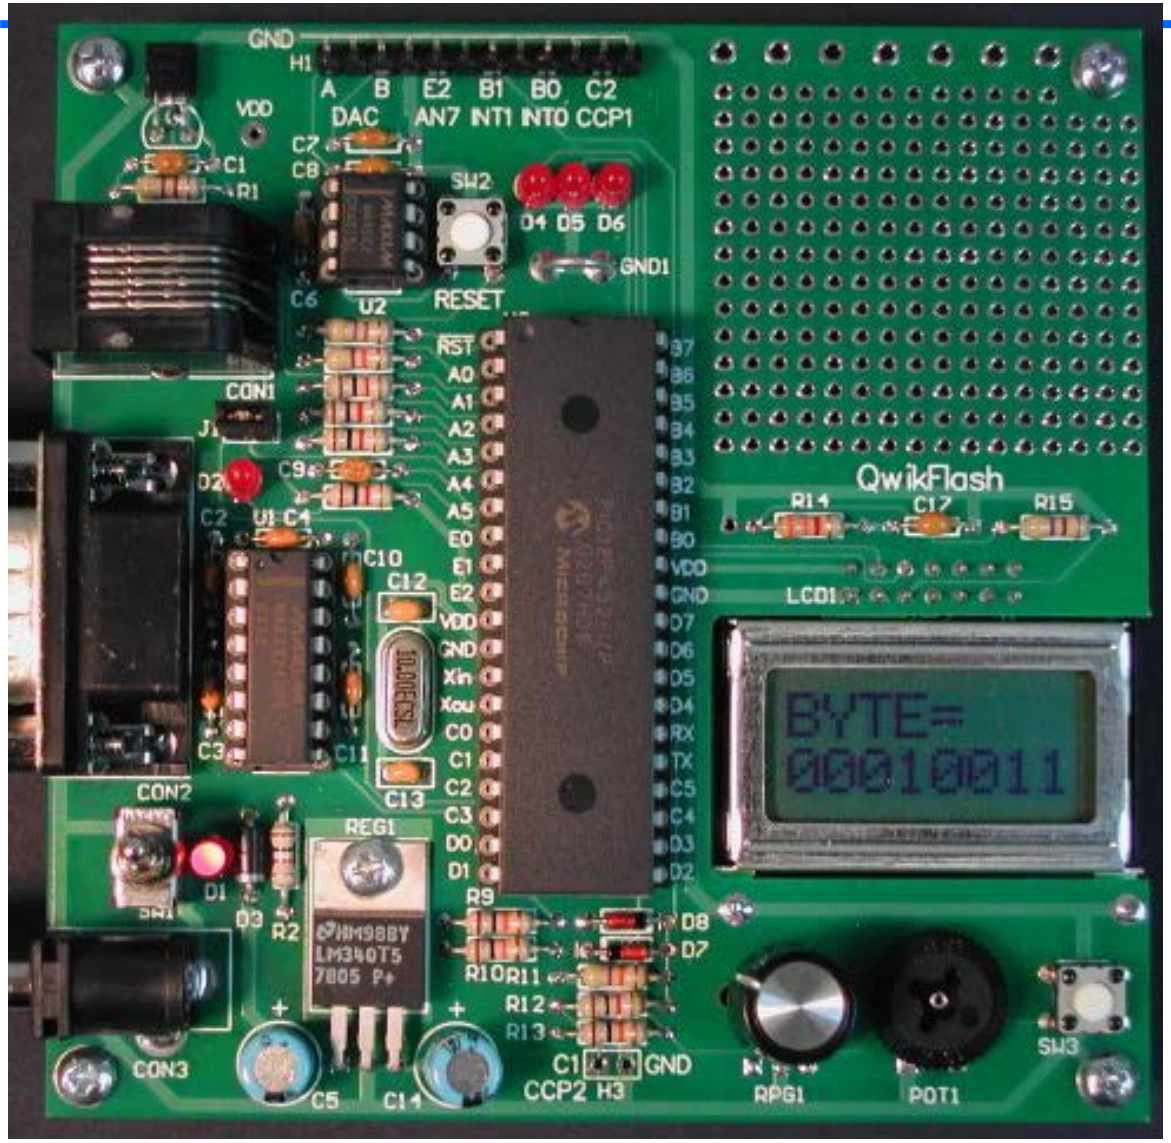
- Current can flow in (pin at 0 level) and out (pin at 1 level) of port pins.
- This current is limited by the design of the IC.
- Fan-out is really the number of logic gates a pin can drive but is closely connected to the total current of pins.
- Arguably, for microcontrollers it is more important to remember the total current drawn (see LEDs driven in QwikFlash)

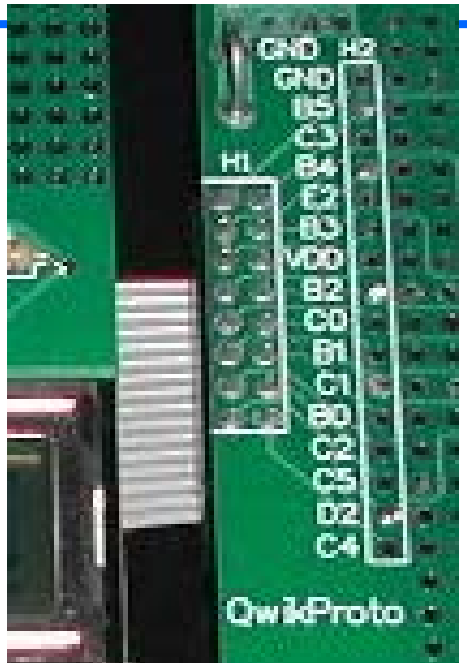
Maximum output current sunk by any I/O pin	25 mA
Maximum output current sourced by any I/O pin	25 mA
Maximum current sunk by PORTA, PORTB, and PORTE **(Note 3)** (combined)	200 mA

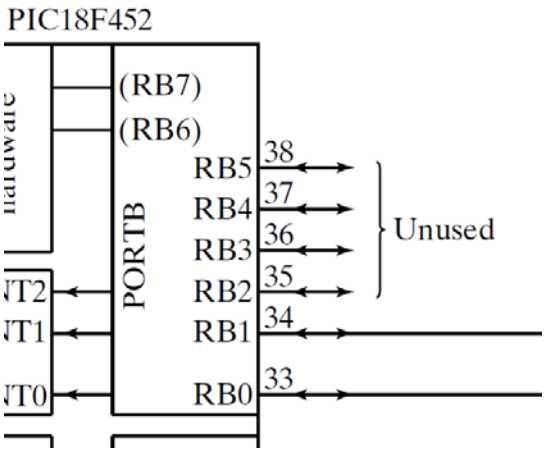
Example of Interfacing PIC to Components on QwikFlash



Example of Interfacing PIC to Components on QwikFlash







Example: Parallel Digital Output LCD Control

Driving LCD Controllers

(textbook chapter 12,
PICBook chapter 7)

LCDs

- Liquid Crystal Displays are frequently used with PICs
- Usually have their own controller for logic and receiving commands
- Commonly have parallel digital inputs where interfacing is done (there are some with serial interfaces as well)
- Usually go through some own initialization thus a couple hundred milliseconds after reset should pass before talking to them.
- Usually have to be first initialized before use.

LCD Common Pins

- **Supply, “ground,” and LCD contrast voltage**
- **Register Select (RS)**
  - **RS=0** for sending instructions (such as clear screen, or defining characters)
  - **RS=1** for sending data to be displayed
- **Enable (E)**
  - Essentially a clock input; a high-low transition will cause the LCD to latch in the data on the data pins
- **Data (D0-D7) or (D0-D3)**
  - The parallel interface pins (can use all 8 or just 4)
- **Read/Write (R/W)**
  - Direction of I/O (if used only as a display, “grounding” this is necessary)

Hitachi HD44780 LCD controllers are by far the most used

Connections to QwikFlash

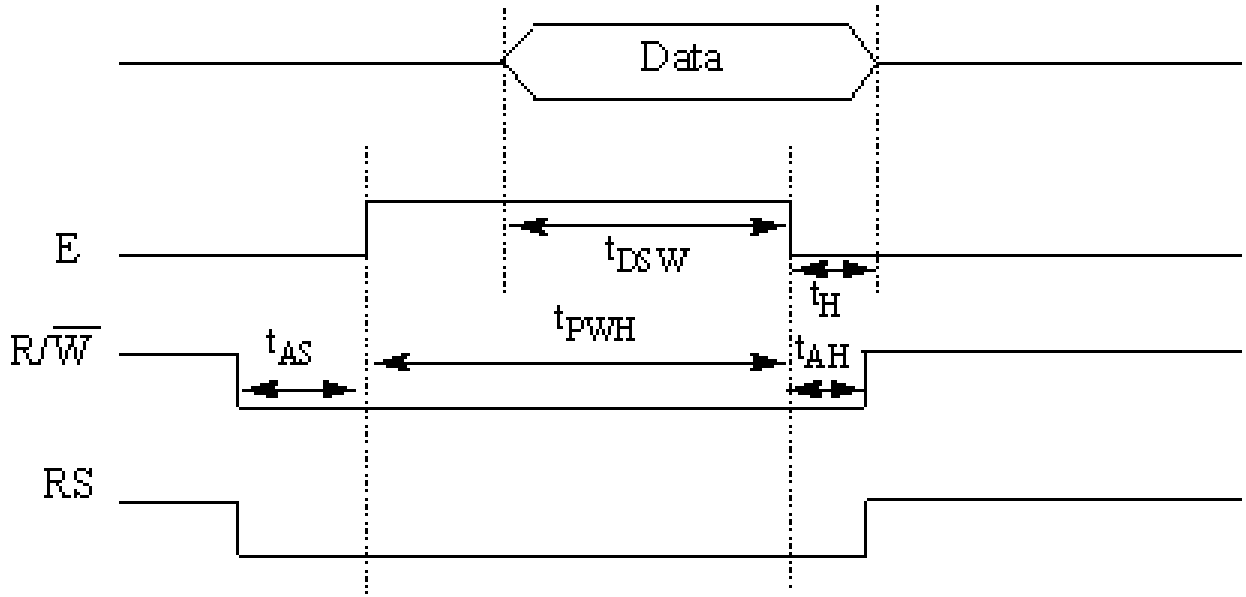
Typical LCD Timing for Displaying (Write)



t_{PWH} = Enable pulse width = 450 ns (minimum)
t_{DSW} = Data setup time = 195 ns (minimum)
t_H = Data hold time = 10 ns (minimum)
t_{AS} = Setup time prior to E (going high) for both RS and R/W = 140 ns (minimum)
t_{AH} = Hold time after E has come down for both RS and R/W = 10 ns (minimum)

Example Initialization (Nibble Interface)

1. Wait 100ms to make sure own initialization has occurred
2. RS=0, (all commands)
3. 3 times: E=1,D=3,E=0, wait
4. 2 times: E=1,D=2,E=0, wait (set nibble iface)
5. E=1,D=8,E=0, wait, E=1,D=0,E=0 (two line display)
6. E=1,D=1,E=0, wait, E=1,D=0,E=0 (clear display)
7. E=1,D=0xC,E=0, wait, E=1,D=0,E=0 (Turn off cursor, turn on display)
8. E=1,D=1,E=0, wait (auto cursor increment)

Cursor Positioning

- All commands (RS=0) where the MSB is set are cursor positioning commands
- Row 1 begins with 0x80 (1000 0000)
- Row 2 begins with 0XC0 (1100 0000)
- Positions are counted left to right and auto increment can be enabled (no need for cursor positioning for short strings)

Special Characters

- ASCII lower 128 characters are easy to display (just send ASCII codes) with a few exceptions
- Japanese characters at codes 0xa0 to 0xff
- Eight user defined characters 0x0 to 0x7
- All command codes (RS=0) with MSBs ’01’ are character generating commands
- 5x8 characters are then defined by sending their bitmaps (sending 8 bytes where upper three bits are always ignored)

Debugging

- LCDs (as they are displays) are a great tool for debugging embedded code.
- Of course we need to assume that the microcontroller works
- Displaying variables and port statuses can be very helpful
